Q: Dealing with large code changes in distributed teams Our development team is working on an application, but now it is being moved to a different team. The old team is transitioning responsibilities to a new team with a different language and way of working. The old team wants to focus their time on improving the application, but we have to test the change in their language. What would be the best way of dealing with this? Make the code change locally and have the new team accept it, then test the new change in the local branch. Make the change in the new language and have the old team test the code and then merge it into master. Do whatever we can to try to keep the old and new code separate. Thanks. A: You are describing a situation where you have two development teams. Then the code will have to be in two places. That means you have to tell the two teams where to put their changes. You will have to decide whether they are to work on a fork of the codebase, or a branch of the codebase, or whether they are to work independently. Depending on how you chose to do that, it could be an overall nightmare. You might have to deal with errors on the merged product. You might also have to deal with bugs in the new code being lost because the new code hasn't yet been shipped. You should also look at whether you have a good conflict resolution mechanism. That is the cost to your original development team; you are also making the transition more difficult for them. That is not a justification to make it more difficult for them. You will almost certainly have to migrate the codebase from one language to another. That will make it more difficult. Any new code will be done in your new team's language. That will also make it more difficult. However, in my experience, you cannot avoid this situation. The way you choose to do that is still the biggest factor in your success with the transition, and will decide whether you have a smooth, or a messy, transition. A: You should work with the new team to avoid needless "code in different languages" issues. The old team should get some help to get them acquainted with the new codebase by going over a checklist of areas where the new codebase is different from the old one. This will help them decide where the changes from the new codebase are meaningful, and where are changes that

What's New in the Photoshop 2021 (Version 22.2)?

Been wanting to try something new and decided to check out what #fantasy is like on Ethereum. Also went and bought Ether because I never bought any at launch. 1: #Giveaway Seems like a lot of fun. 2: #FantasyLand Something like a twitter contest or contest interface for Ethereum. The winner gets ETH or some other prize 3: #Pricing This video compares Ethereum and Dogecoin pricing. 4: #Interactive mapping A nifty concept I saw about 5 days ago on Reddit. You can build your own estate and basically go around it. You can create your own character or avatar and then see your holdings, the coins that you own and how much time you have left to transfer them to the Ethereum address of your choice. Also, you can even get rewards for things like voting in the polls which can add to your assets. This is a really neat concept and is basically Ethereum 2.0 in the making. I think it's really cool and is going to be a lot of fun for people to create their own. // view } } view.setUserVisibleHint(isVisible()); } } private class ViewHolder extends RecyclerView.ViewHolder implements View.OnClickListener, View.OnLongClickListener, View.OnTouchListener, OnScrollListener { private final View view; private boolean expanded = false; public ViewHolder(View itemView) { super(itemView); view = itemView; view.setOnClickListener(this); view.setOnLongClickListener(this); view
